

## **Utilizing a Standardized Language in an EHR to Collect Data for Quality Programs, Research, and Reporting**

4th Annual NDNQI Data Use Conference  
Catherine Kleiner, PhD, RN  
Carol Petersen RN, BSN, MAOM, CNOR

### **Objectives**

- Describe mapping standardized nursing language to traditional record labels and values in an EHR.
- Identify how standardized data elements can facilitate research, quality initiatives and reporting.

## Standardized Languages

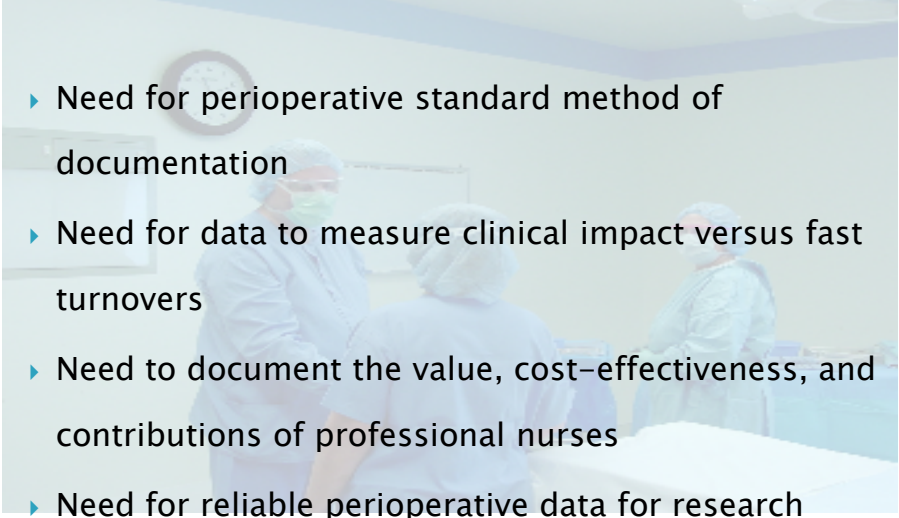

- ▶ Where is the valid, reliable, interpretable, and reusable data from the patient record?
- ▶ Is the clinical record a data mine or a data cemetery? (Ozbolt, 2000)
- ▶ Standardized data allows nurse scientists to compare interventions effectiveness on patient outcomes.

## What is PNDS?

### Definition

- Clinically useful data set that describes nursing practice
- Controlled vocabulary
  - » Single concept
    - » Concept is the embodiment of a particular meaning
    - » Has only one coherent meaning
    - » Concept Permanence
    - » Unique identifier
    - » Formal definitions

## WIIF for Perioperative Nurses

- 
- ▶ Need for perioperative standard method of documentation
  - ▶ Need for data to measure clinical impact versus fast turnovers
  - ▶ Need to document the value, cost-effectiveness, and contributions of professional nurses
  - ▶ Need for reliable perioperative data for research

## Advantages for Nursing Executives

- Provides reliable homogeneous data
- Supports benchmarking activities across settings & institutions
- Comparison of clinical data from large number of patients/facilities
- Provides valid clinical data for decision making & policy formulation
- Provides standardized language & definitions to develop databases to support the evaluation of resource utilization
- Assists in the examination of the relationship of cost to quality & effectiveness

## Why PNDS?

- Provides clarity, preciseness, and consistency
- Makes perioperative practice visible
- Reflects clinical workflow
- Need for reliable and valid perioperative data
- Enables data capture to compare effectiveness
- Integrated into the electronic health record (EHR)

## ANA Recognition of PNDS

- ▶ 1999 PNDS recognized as a terminology that describes perioperative nursing practice
- ▶ Criteria:
  - Supports one or more components of the nursing process
  - Unique contribution to nursing practice
  - Clinically relevant
  - Tested for reliability and validity
  - Supports one or more of the nursing domains
  - Unique identifiers

## **PNDS Recognized by:**

- ▶ National Library of Medicine
- ▶ American Society for Testing & Materials
- ▶ American National Standards Institute
- ▶ HL 7
- ▶ Federal agencies
  - National Committee on Vital & Health Statistics
  - Health Care Financing Administration
  - National Center for Health Statistics
- ▶ Mapped in SNOMED

## **PNDS Building Blocks**

- ▶ Consists of data elements that are:
  - Clearly defined
  - Common to all procedures
  - Consistent across time
  - Related to the delivery of care
  - Appropriate for use in any surgical setting

## Outcomes

- Outcomes reflect observable, measurable, physiological, and psychological responses to perioperative nursing interventions
- **Unique identifier**

## Nursing Diagnosis

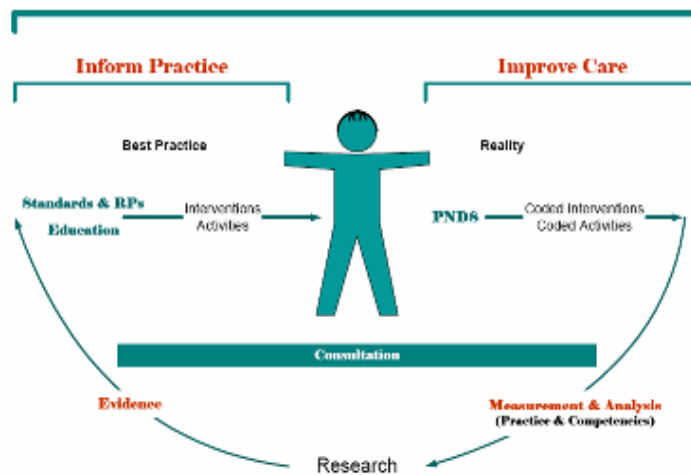

- Definition  
“Concise clinical judgment label of a perioperative patient problem formulated for the purpose of directing nursing actions intended to achieve the expected outcomes.”
- **Unique identifier**

## Interventions

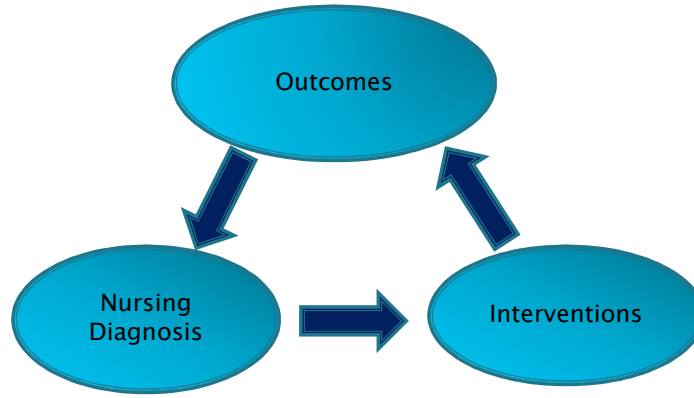

- Nursing treatments, actions and interventions
- Applicable across all perioperative settings
- Patient care focused
- Multiple activities
- **Unique identifier**

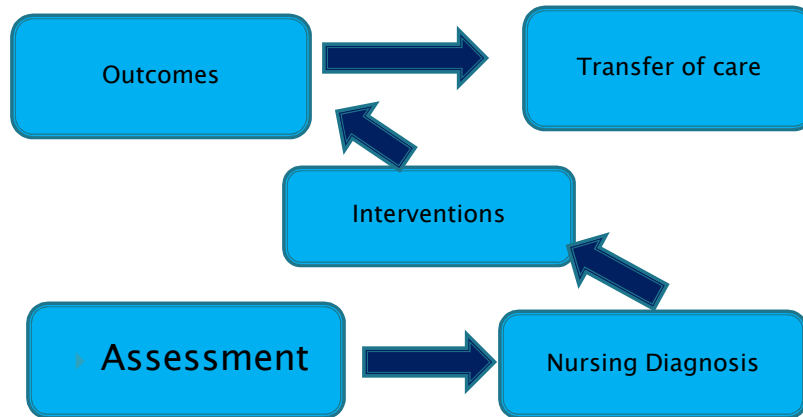

## Evidence based cycle

## Method of Entry into PNDS

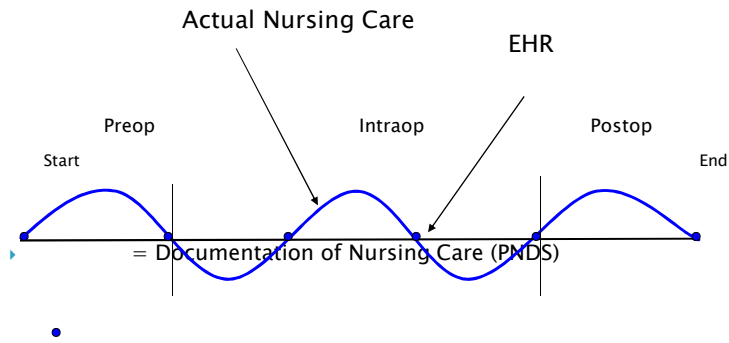

## How the Nurse Thinks

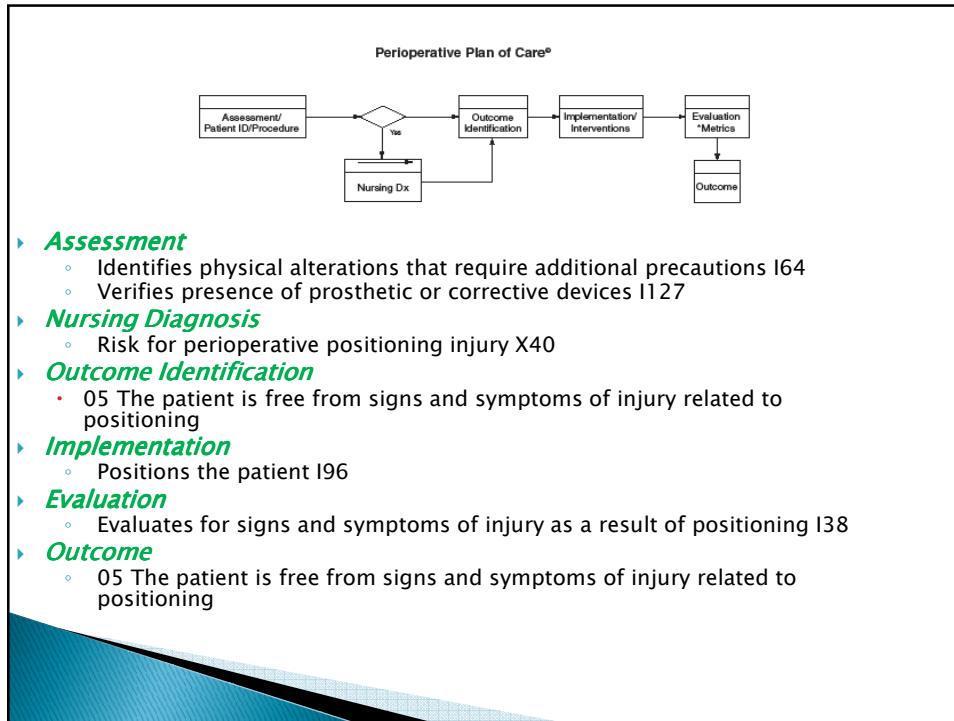

## Intersection of nursing care with documentation

## Nursing Process and Workflow

### Perioperative Plan of Care®

## Individualizing Patient Care

<ul style="list-style-type: none"> <li>◦ 24 years old</li> <li>◦ Healthy</li> <li>◦ Height 6'2"</li> <li>◦ Weight 190</li> <li>◦ Male</li> <li>◦ Procedure – Right Inguinal herniorrhaphy</li> </ul>	<ul style="list-style-type: none"> <li>◦ 75 years old</li> <li>◦ Frail</li> <li>◦ Left side paralyzed – stroke</li> <li>◦ Height 6'2"</li> <li>◦ Weight 130</li> <li>◦ Male</li> <li>◦ Procedure – Right Inguinal herniorrhaphy</li> </ul>
<ul style="list-style-type: none"> <li>• Risk for impaired skin integrity X51</li> <li>• Risk for perioperative positioning injury X40</li> </ul>	<ul style="list-style-type: none"> <li>• Impaired physical mobility X34</li> <li>• Ineffective tissue protection X44</li> <li>• Ineffective tissue perfusion X61</li> </ul>

## PNDS Grouping

PNDS

- 196 Positions the Patient

Record Label

- "Fill in the blank"
- Documentation question to be answered

Value

- The answer to the documentation question
  - Drop down list
  - Free text

## Standardized Documentation Central Repository

- Provide reliable clinical data
- Comparison of clinical data from large number of patients/facilities
- Supports databases to measure outcome data, monitor & evaluate quality & effectiveness of care
- Supports benchmarking activities across settings & institutions
- Examination of the relationship of cost to quality
- Facilitate operational management
